

AI proposes. Humans determine. Cryptography proves.

Interlok sits in front of every consequential thing your agents do: it discovers their reach, gates the write path, records a named human's approval, and reverses what should never have happened.

THE FOUR-QUESTION FLOW

1 · ACTOR	Who is acting? A durable identity — an agent, a service, a human. Not a session token.
2 · TARGET	What does it land on? The system that changes: a repo, a database, a payment processor, a patient record.
3 · ACTION	Is this a write path? The operation is classified. Reads pass. Consequential writes are held for a decision.
4 · DECISION	Allow, deny, or ask a human? A deterministic policy answers in-line, in single-digit milliseconds, and the answer is recorded.

THE TAMPER-EVIDENT LEDGER

Every scan, decision, approval and reversal becomes one append-only ledger entry. Each entry hashes its own canonical payload, then hashes that together with the previous entry's hash — a chain. Edit any historical payload and every hash after it stops matching, so the tampering is provable rather than merely suspected. Entries are co-signed with a P-256 key; credential values are never stored, only fingerprints.

#118	gate.decision	payload_hash	4f9c...	prev	91ab...	entry	7d20...
#119	approval.commit	payload_hash	88e1...	prev	7d20...	entry	a0c4...
#120	reversal.receipt	payload_hash	12bd...	prev	a0c4...	entry	ff31...

FOUR STAGES

- Discover**
Grade the agent estate A-F against a deterministic ruleset.
- Gate**
In-line allow / deny / hold on the write path, with idempotency.
- Approve**
A named human resolves the hold; quorum-aware, expiring.
- Reverse**
Planned, retried undo with a signed receipt and a diff first.

WHAT CHANGES BETWEEN PLANS

- Free — \$0**
10,000 decisions/month. Observe mode: nothing is blocked, everything is logged.
- Team — \$499**
250,000 decisions. Real holds, Slack approve/deny, signed callbacks, evidence room.
- Enterprise**
Volume commit, customer-held signing keys, design-partner Reverse connectors.
